EDUCATION

Northeastern University, Boston, MA

May 2028

Bachelor of Science in Computer Science and Mathematics

Honors: Dean's List, GPA: 4.0/4.0

Relevant Courses: Software Engineering, Algorithms and Data, Object-Oriented Design, Foundations of Data Science, Matrix Methods in Data Analysis and Machine Learning, Theory of Computation

Activities: Artificial Intelligence Club (*Member; attended 5-week AI Bootcamp*), Oasis (*Member*)

TECHNICAL SKILLS

Languages: Java, JavaScript, Python, Swift, Racket, HTML, CSS, TypeScript

Development: React, Spring Boot, Node.js, PostgreSQL, SQLite, WebSocket, SwiftUI, Swing

Testing & Tools: AWS, JUnit, Jest, Pytest, Git, Xcode, LaTeX, Jenkins, Dynatrace, Athena/Wheelhouse, Docker

EXPERIENCE

Software Engineer Intern, **Chewy**, Boston, MA

June 2026 – August 2026

- Led the feature-flagged modernization of a 480,000-event-per-day OMS processor from split Node.js/TypeScript Lambda components to a consolidated Java/Spring Boot service on EKS, enabling zero-downtime migration and retirement of the legacy repository's final service.
- Uncovered a critical production data-loss defect silently dropping 500-600 failed messages daily and established the dead-letter-queue (DLQ) failure-handling architecture for the Java migration to preserve 100% of failed events for diagnosis and remediation.
- Defined Dynatrace observability for the Java service tracking queue depth, DLQ depth, and error rate, with anomaly-detection criteria that alert via Slack on threshold breaches.

AI-Caring Research Assistant Co-op, **Northeastern University**, Boston, MA

Jan. 2026 – June 2026

- Developed a multi-component elderly care reminder system with a Python backend, Node.js WebSocket server, and Swift iOS app deployed across 40+ care homes.
- Implemented real-time step tracking via the AgeWell API and built device health monitoring endpoints within the WebSocket server for remote diagnostics across deployed devices.
- Provisioned AWS EC2 instances managed via PM2 to replicate the production environment, enabling isolated testing and validation of system functionality.

PROJECT EXPERIENCE

The Invasion (*React, Spring Boot, PostgreSQL*)

June 2025 – Present

- Collaborated with a partner to develop a full-stack tower defense game in which players can strategically deploy defensive units to prevent enemy waves from reaching their base across 20+ progressively challenging levels.
- Implemented JWT-based user authentication and persistent PostgreSQL save states, enabling secure account access and allowing players to resume progress across sessions.
- Built animation and audio systems for unit attacks, movement, and death sequences, managing 110+ sprite sheets and synchronizing sound effects with frame-by-frame animations to deliver responsive audiovisual feedback.

Calendar Application (*Java, Swing*)

May 2025 – June 2025

- Partnered to design and implement a GUI calendar application using the Model-View-Controller architecture, achieving low coupling through interface-based communication and high cohesion within components.
- Developed Schedule-view and Month-view interfaces using Command design patterns for event handling, allowing users to create, edit, and manage events with persistent data storage across multiple calendar instances.
